Hello 3DVista Team,

I am reaching out for guidance and support regarding a large-scale real estate virtual tour project I'm developing using 3DVista Virtual Tour Pro.

Project Overview:
I'm creating an interactive virtual tour for a residential property development with approximately 436 individual plots across multiple sectors. I've successfully started mapping these plots using polygon hotspots with info windows, but I've encountered some challenges and would like expert guidance from your team.

CHALLENGE 1: Plot Mapping Accuracy and Precision

I'm currently using polygon hotspots to map each plot boundary. However, I'm facing these issues:

1. Manual Point Adjustment: When creating polygon hotspots, I have to manually adjust each point by dragging the handles on the panorama viewer. This is extremely time-consuming and imprecise, especially for a project with 436+ plots.

2. No Pixel-Level Precision: I cannot manipulate the size of polygons using pixel measurements. I can only adjust by dragging corner points, which makes it impossible to achieve precise, uniform sizing for plots of specific dimensions.

3. Accuracy Concerns: For a real estate project where plot dimensions are critical, I need a method to ensure geometric accuracy. The current workflow doesn't allow me to input exact measurements or use coordinate-based positioning.

Is there a feature in 3DVista that allows for:
- Importing polygon coordinates from external data sources (CAD, GIS, CSV)?
- Using pixel-based or coordinate-based polygon positioning for precision?
- Batch polygon creation or templates for uniform plot sizes?

CHALLENGE 2: Search & Navigation Features

I want to implement search functionality similar to what's found in professional real estate tours, where users can:

1. Search for a plot by number in a search box
2. Have the panorama automatically navigate/highlight that specific plot
3. Display a pin or marker on the found plot
4. Show a zoomed-in or centered view of that location

Current Observations:
I've seen this feature implemented in professional real estate virtual tours.

Questions:
- Is there a native 3DVista feature for implementing searchable plot/hotspot functionality?
- Can hotspots be tagged or indexed for search purposes?
- Is this typically implemented using custom scripting/API, or is there a plugin/feature I'm missing?
- Are there any official tutorials or documentation for this feature?

Request for Assistance:

I would greatly appreciate guidance on:
1. The most efficient workflow for mapping 436+ plots with geometric accuracy
2. Best practices for large-scale polygon hotspot creation
3. Methods to implement search and navigation features for plot discovery
4. Any available tools, plugins, or features I might be missing

I have a licensed copy of 3DVista Virtual Tour Pro and am committed to using 3DVista for this project, but I need expert guidance to optimize my workflow and implement these features effectively.

Thank you for your support. I look forward to your response.

Best regards

FOLLOW-UP: Plot Mapping Guidance Request

I contacted you previously regarding large-scale plot mapping (436+ polygon hotspots) for a real estate project but haven't received a response.

License purchased via: legal.manojava@gmail.com

Need urgent guidance on:
1. Efficient workflow for mapping 436+ polygon hotspots with geometric accuracy
2. Best practices for large-scale polygon hotspot creation
3. Available tools, plugins, or features for this use case

We're committed 3DVista customers on a project deadline. Please advise.

Thank you.

To: Pankaj Verma <build91dev1@gmail.com>

Hello Pankaj,

Thank you for reaching out to us regarding your large-scale real estate virtual tour project using 3DVista Virtual Tour Pro. We're excited to assist you with the challenges you're facing!

Challenge 1: Plot Mapping Accuracy and Precision

1. **Manual Point Adjustment**: While currently, dragging points manually is the way to adjust polygon hotspots, we understand it can be quite tedious for a project with many plots. Unfortu feature to import polygon coordinates from external sources like CAD or GIS.
2. **Pixel-Level Precision**: We understand your need for pixel-based adjustments. Currently, the polygon hotspots are adjusted using the panorama viewer. However, we recommend keep continuously enhance our software functionalities.
3. **Batch Creation or Templates**: At present, there is no built-in feature for batch processing polygon hotspots with exact geometries. This is an area where users often request improvem ways to optimize our tool's capabilities.

Challenge 2: Search & Navigation Features

1. **Search Functionality**: Currently, 3DVista does not come with a native feature that allows users to search for plots by number directly within the virtual tour. Implementing a search func would typically require custom scripting.
2. **Hotspots Tagging**: While there isn't a straightforward feature for tagging hotspots for search purposes, using a naming convention in your hotspots may assist you in organizing them
3. **Implementation**: Implementing complex features like the ones you've described typically requires custom scripting. We don´t offer support on that but you can ask our users in the FB

Best regards.

Hello,

Thank you for your detailed response and for clarifying the current limitations regarding polygon mapping and search functionality.

I understand that manual polygon creation is the current workflow and that batch processing/CAD imports are not available. Given these constraints, I'd like to explore an alternative approach that might make the plot mapping process more manageable.

Question: Can I stitch/overlay a flat floor plan image onto my aerial panorama in 3DVista?

If the floor plan (which clearly shows all 436 plot boundaries) could be aligned and integrated with the aerial pano, it would serve as a visual reference layer, making it much easier to trace polygon hotspots accurately along the pre-defined plot boundaries.

I have attached:
1. The aerial panorama (stitched from drone images)
2. The CAD floor plan layout showing all plot boundaries

Could you please advise if this approach is feasible within 3DVista, and if so, what would be the recommended workflow? Are there any tools, settings, or techniques for panorama-to-flat-image alignment/compositing?

Alternatively, if this needs to be done externally before importing to 3DVista, what would be the best practice to maintain panoramic projection compatibility?

I appreciate your continued support and look forward to your guidance on this approach.

Best regards.

Hi
I am afraid it will not be optimal either.
What you can do is create a map using JS outside of the tour and use deep linking:

Please check this:
https://www.3dvista.com/es/blog/deep-linking/
https://www.3dvista.com/en/blog/the-url-of-a-virtual-tour/
